## Research

### Research Interest

My research lies in the interface between Complex Geometry, Algebraic Geometry and Theoretical Physics. I am especially focused on Topological Quantum Field Theories, Geometric Invariant Theory, representation theory and Hodge theory. Moreover, I am interested in Algebraic Topology, especially in higher category theory, functor calculus and knot theory. As a byproduct, I am interested in moduli spaces, mainly moduli spaces of Higgs bundles and flat connections, and their relation with character varieties, gauge theory and mirror symmetry. Additionally, I also work on theoretical Machine Learning, with special attention to the application of mathematical techniques. In particular, I research in Recommender Systems, particularly in beyond-accuracy models, as well as Deep Learning, Generative Adversarial Networks and Manifold Learning through geometric flows.
